DEFINITION AND MEASUREMENT OF CPI AND INFLATION RATE

The Consumer Price Index (CPI) is a macroeconomic indicator that provides a general measure of changes in the average prices of goods and services commonly purchased by consumers relative to a base period (the price reference period is 2024). The inflation rate is directly computed from the index. The inflation rate is the relative change in CPI between periods. Inflation rate is reported year-on-year (annual inflation rate) and month-on-month (monthly inflation rate). CPI is constructed using the following key variables: weights derived from estimates of household expenditures (the weight reference period is 2023), prices collected from selected retail outlets across the 36 States and FCT (both urban and rural), and quantities of goods and services. In the current CPI, there are 74 population strata, which are the urban and rural parts of Nigeria's 36 states and the FCT. The CPI basket has 242 item strata, defined by the 2018 version of Classification of Individual Consumption According to Purpose (COICOP). The 2018 version of COICOP has 4 levels in its hierarchy: DIVISIONS, GROUPS, CLASSES, and SUB-CLASSES.

STATE PROFILES

STATE PROFILES

When analysing price movements under this section, it is essential to note that the CPI is weighted by consumption expenditure patterns that vary across States and locations. Accordingly, the weight assigned to a particular Food or Non-Food item may differ from State to State, making interstate comparisons of consumption baskets inadvisable and potentially misleading.
